CHILD'S DISPOSABLE TOILET SEAT ADAPTOR WITH SIDE HANDLES AND FOLD-UNDER FLAP

BACKGROUND OF THE INVENTION

1. Field of the Invention

9 The present invention relates generally to disposable child toilet seat adapters which
10 facilitate a toddler's use of public and other unfamiliar toilets and provide a clean seating
11 surface.

13 For many, the prospect of using a public toilet is an unpleasant one. Thoughts of how
14 many strangers have used the toilet before, and when and how well it was last cleaned, are
15 enough to make some people do extraordinary things to avoid the experience. In addition, when
16 a child needs to use the restroom, they generally can't wait. Exacerbating the foregoing general
17 concern are the additional difficulties arising because public toilet seats are generally designed
18 for adults, and children simply don't "fit" so well.

20 || 2. Description Of Prior Art

22 Most toilets, including most public toilets are designed for use by adults. Small children
23 who have learned to use toilets must generally be held on or over the seat. In addition to the size
24 issue, the use of public and other unfamiliar toilets also involves the potential risk of infection,
25 disease or contact with filth if the available toilet has not been cleaned adequately, or at all, since
26 its last uses. This potential condition also suggests the need for some clean barrier between the
27 user and the toilet. While products such as paper seat covers are often provided for such
28 purpose, they are designed to fit the adult-sized toilet and provide little protection for a smaller

1 child. In addition, the tendency of such temporary barriers to move and shift is undesirable and
2 creates risks of contamination not present with a more stable barrier.

3

4 Several inventions have described disposable and non-disposable child or infant toilet
5 seat adapters. These are identified and briefly described below:

6 1. United States Patent 2,548,238 issued to Potts et. al. on April 10, 1951 for
7 "AUXILIARY TOILET SEAT".

8

9 2. United States Patent 2,716,244 issued to Wendel on August 30, 1955 for "TOILET
10 SEAT ADAPTOR".

11

12 3. United States Patent 2,825,070 issued to Alexander on March 4, 1958 for
13 "DISPOSABLE INFANT'S TOILET SEAT".

14

15 The devices of the prior art suffer from either not being disposable, from involving set-up
16 procedures which are too cumbersome or complex, from having inadequate means for keeping
17 the device in place on the toilet, and/or from failing to provide a position for the toddler's hands,
18 which would otherwise be inclined to grasp the sides of the toilet, which are potentially
19 contaminated with filth.

20

21 In addition to the above prior art, the following prior art patents are also relevant:

22 1. United States Patent 1,582,527 issued to Marks on April 27, 1926 for "SAFETY
23 TOILET SEAT COVER". This device discloses the concept of side flaps which may be put
24 under the seat to secure the disposable seat to the toilet. However, they involve an extensive
25 amount of material under the toilet seat which will make it cumbersome and more difficult for a
26 child to sit on the seat. In addition, the material is made out of flimsy paper which is not
27 substantial enough to support the weight of a child and not substantial enough to firmly hold the
28 disposable seat on the toilet.

1 2. United States Patent 1,522,699 issued to Reid on January 13, 1925 for "TOILET
2 SEAT COVER". This device basically has surrounding rims which enable the toilet seat to be
3 wedged around the rim but in fact do not securely hold the toilet seat cover on the toilet seat.

4
5 3. United States Patent 6,473,911 B2 issued on November 5, 2002 to Weiss for
6 "DISPOSABLE, COMPACT, PORTABLE TODDLER-SIZE TOILET SEAT PROTECTOR".
7 This device is also a toilet seat cover but has side flaps and front flaps which serve to wedge the
8 front portion of the toilet seat between them. However, this is not a secure and stable way to
9 assure that the toilet seat will remain on the toilet. In addition, the Weiss device has a large
10 amount of folding that needs to be created before the disposable toilet seat cover is operational
11 which makes it impractical for a parent to assemble while an impatient child is waiting to
12 eliminate.

13
14 All of the above prior art patents lack the concept of having a handle by which the child
15 can firmly grasp onto the toilet seat and remain on the toilet seat during the process of
16 eliminating. In addition, none of these devices have a proper secure way of assuring that the
17 toilet cover will be firmly held on the toilet seat while the child is moving around on the toilet
18 seat during the process of elimination. There is a significant need for a new and improved
19 disposable toilet seat cover with these improved features.

SUMMARY OF THE INVENTION

In accordance with the present invention, a barrier comprised of a single sheet of inexpensive, disposable and foldable material, sufficient in width to rest upon the full-size toilet seat, with a central cutout sized and positioned so as to provide a smaller toilet seating surface to accommodate the buttocks of a toddler, and which is capable of supporting a child's weight as a result of such material's natural firmness and folds along the distal edge, comprises a disposable toilet seat cover/adapter. The present invention is held in place by one or more flaps which are folded around and under the hinged adult seating surface so that such flap(s) rest(s) sandwiched between the underside of the adult seating surface and the top of the toilet rim. The weight of the child thus compresses the flap(s) and holds the seat adaptor in place.

In addition, the preferred embodiment includes handles for the child to grasp, thus limiting the temptation to touch surfaces of the toilet which might be contaminated with filth.

Objects and Advantages

The objects and advantages of the invention are:

- (a) to provide an adapter-barrier means for a small child to use an adult-size toilet;
- (b) for such means to be light and easily transported;
- (c) for such means to be inexpensive;
- (d) for such means to be capable of being assembled or prepared for use quickly and easily;
- (e) for such means to remain in position while in use;
- (f) for such means to provide a position for the child's hands so that there is little temptation to touch or grab exposed parts of the toilet.
- (g) for such means to be easily disposed of after use.

1 Further novel features and other objects of the present invention will become apparent
2 from the following detailed description, discussion and the appended claims, taken in
3 conjunction with the drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

Referring particularly to the drawings for the purpose of illustration only and not limitation, there is illustrated:

FIG. 1 is an oblique view of a device of the present invention, consisting of a child seating surface, 1, cutout hole, 2, side support flaps, 4, back support flap 8 and side Handle Flaps, 14, with Handle cutouts, 15;

FIG. 2 shows a side view of the present invention situated on a toilet for use, showing the Front Fold-under Flap 13, situated between the toilet seat, 16 and toilet bowl rim, 17;

FIG. 3 shows the present invention unfolded, with the various sections exposed; and

FIG. 4 shows an alternative embodiment of the present invention wherein the front flap has extensions which are able to extend under the spacers on a toilet seat.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Although specific embodiments of the present invention will now be described with reference to the drawings, it should be understood that such embodiments are by way of example only and merely illustrative of but a small number of the many possible specific embodiments which can represent applications of the principles of the present invention. Various changes and modifications obvious to one skilled in the art to which the present invention pertains are deemed to be within the spirit, scope and contemplation of the present invention as further defined in the appended claims.

Reference numerals in the drawings are as follows:

- 12. 1. Adaptor seating surface
- 13. 2. Cutout hole
- 14. 3. Hole extension
- 15. 4. Side portion of side support flap
- 16. 5. Rear portion of side support flap
- 17. 6. Outside portion of back support flap
- 18. 7. Top, fold-over portion of back support flap
- 19. 8. Inside portion of back support flap
- 20. 9. Tabs
- 21. 10. Finger cut-out for disassembly
- 22. 11. Tab slots
- 23. 12. Vertical portion of front fold-under flap
- 24. 13. Front fold-under flap
- 25. 14. Handle flap
- 26. 15. Handle cutout
- 27. 16. Toilet seat
- 28. 17. Toilet bowl rim

- 1 18. A first extension on the front flap
- 2 19. A second extension on the front flap
- 3 20. Scored vertical centerline
- 4 21. Scored horizontal centerline

5
6 The preferred embodiment of the present invention in its unfolded state is illustrated in
7 Figure 3, and comprises:

8
9 A single piece of corrugated cardboard or other inexpensive, firm material, cut into the
10 shape shown and scored, creased or otherwise adapted to fold along the dotted lines. By the cuts
11 and folds, the piece is comprised of a seating surface, 1, of sufficient width to rest on standard-
12 sized toilet seats, with central cutout, 2, sized for the smaller buttocks of a toddler. Additional
13 strength is provided by the assembly of 2-part Side Flaps, 4-5; and a Rear Support Flap, 6-10,
14 which are folded to create a vertical ridge around the rear edge and the rear portion of the side
15 edges of seating surface, 1.

16
17 The present invention is assembled for use by folding the flaps as follows: with the
18 Seating Surface, 1, situated horizontally, Side Flaps, 4, are folded up to a vertical position along
19 the side edge of seating surface, 1, so as to be perpendicular to said seating surface, 1. Rear
20 Portion of Side Support Flaps, 5, are folded such that they are vertical and perpendicular to the
21 Side Flaps 4, situated along the rear edge of Seating Surface 1, adjacent to the Outside portion of
22 back support flap, 6. The Outside portion of back support flap, 6, is folded up to a vertical
23 position along the outside of Rear Portion of Side Support Flaps, 5, and the Inside portion of
24 back support flap, 8, is folded down over the inside of Rear Support Flaps, 5, and the tabs, 9, are
25 then inserted into the tab slots, 11. The seat is anchored in place by a Front, Fold-under Flap, 13,
26 which is folded down and then rearward under the adult toilet seat, 16, such that the Vertical
27 portion of Front fold-under flap, 12, covers the front edge of the toilet seat, 16 in Fig. 2, and the
28 Front, Fold-under Flap, 13, is sandwiched between the toilet seat, 16, and toilet bowl rim, 17, as

1 shown in Fig. 2. Handles are provided by a handle flap, 14, with handle cutouts, 15, which are
2 folded to a vertical position for grasping.

3

4 Figure 1 shows the present invention in its folded position, ready for use.

5

6 Figure 2 shows the present invention situated on a toilet, ready for use.

7

8 After use, the unit is removed from the toilet; the rear portion of the device can be
9 unfolded by inserting a finger in the Finger cut-out for disassembly, 10, and pulling the Inside
10 portion of back support flap, 8, such that the Tabs, 9, are removed from the tab slots, 11,
11 allowing the unit to be restored to an unfolded condition and discarded.

12

13 ALTERNATIVE EMBODIMENTS

14 In the first alternative embodiment (not shown), the position of fold under flaps and
15 handles are switched, such that two flaps are folded under the adult seat from the side, in the
16 approximate position of the handles in the preferred embodiment, and a single handle is situated
17 in a position to fold up from the center of the front section.

18

19 The barrier may be composed of extruded or corrugated plastic or other inexpensive but
20 firm material.

21

22 The foldover flap assembly along the rear of the seat can be eliminated if the strength of
23 the material used for the blank can bear sufficient weight to support a toddler without such folds.

24

25 The front of the Cutout Hole can contain a flap that folds up to provide a splash guard,

26 similar to that provided in Alexander, 2,825,070.

27

28 The Front Fold-under flap can be divided into sections such that the center portion hangs
straight down, providing a barrier between the child's legs and the front of the toilet, and the

1 remaining, side portions fold under in the manner otherwise described herein.

2

3 The entire unit may contain additional folds to reduce it's storage size and facilitate its
4 packaging and transportation.

5

6 ADDITIONAL ALTERNATIVE EMBODIMENTS

7 In addition to the above alternative embodiments, a preferred improvement in the present
8 invention is to create extensions as illustrated by Numbers 18 and 19 on the front flap of the
9 child toilet seat adapter. The front flap 13 is located along the front edge of the toilet seat
10 adapter and is also located adjacent the front end of the toilet when the barrier is positioned on
11 the toilet seat. The front flap 13 has a pair of oppositely disposed extensions 18 and 19 adjacent
12 opposite sides of the front flap. The front flap folds so that it extends over the front rim of the
13 toilet seat and extends under the front surface of the toilet seat such that a respective extension
14 extends under a respective spacer on opposite locations of the underside of the toilet seat so that
15 the front flap is sandwiched between the underside of the toilet seat and the top of the toilet rim
16 and each respective extension is sandwiched between a spacer and the toilet rim.

17

18 Defined in detail, the present invention is a child toilet seat adapter to be used with a
19 toilet having a toilet rim and an adult full sized toilet seat rotatably resting adjacent the toilet rim,
20 the adult full sized toilet seat having a front surface including an underside having spacers on
21 opposite sides of the underside which position the front of the toilet seat away from the toilet rim
22 when the toilet seat is in its horizontal position, the child toilet seat adapter comprising: (a) a
23 barrier having a front edge and two oppositely disposed side edges, the barrier comprised of a
24 single sheet of foldable material sufficient in width to rest upon the full sized toilet seat with a
25 central cutout sized and positioned so as to provide a smaller seating surface to accommodate the
26 buttocks of a child; (b) a front flap located at the front edge of the barrier and also located
27 adjacent the front end of the toilet when the barrier is positioned on the toilet seat, the front flap
28 having a pair of oppositely disposed extensions adjacent opposite sides of the front flap, the front

1 flap folded so that it extends over the front rim of the toilet seat and extends under the front
2 surface of the toilet seat such that a respective extension extends under a respective spacer on
3 opposite locations of the underside of the toilet seat so that the front flap is sandwiched between
4 the underside of the toilet seat and the top of the toilet rim and each respective extension is
5 sandwiched between a spacer and the toilet rim; (c) a first handle extending upwardly along one
6 lengthwise edge of the barrier, the first handle having a cutout opening; and (d) a second handle
7 extending upwardly along a second lengthwise edge of the barrier and parallel to said first
8 handle, the second handle having a cutout opening; (e) whereby, when a child is seated on the
9 barrier, the weight of the child compresses the front flap and its extensions between the toilet
10 seat and the toilet seat spacer and the toilet rim to thereby cause the adapter to be held in place
11 and the child grasps each handle through its cutout so that the child remains securely on the
12 adapter.

13

14 Defined broadly, the present invention is a child toilet seat adapter to be used with a toilet
15 having a toilet rim and an adult full sized toilet seat rotatably resting on the toilet rim, the adult
16 full sized toilet seat having a front surface including an underside which rests against the toilet
17 rim, the child toilet seat adapter comprising: (a) a barrier having a front edge and two oppositely
18 disposed side edges, the barrier comprised of a single sheet of foldable material sufficient in
19 width to rest upon the full sized toilet seat with a central cutout sized and positioned so as to
20 provide a smaller seating surface to accommodate the buttocks of a child; (b) a front flap located
21 at the front edge of the barrier and also located adjacent the front end of the toilet when the
22 barrier is positioned on the toilet seat, the front flap folded so that it extends over the front rim of
23 the toilet seat and extends under the front surface of the toilet seat so that it is sandwiched
24 between the underside of the toilet seat and the top of the toilet rim; (c) a first handle extending
25 upwardly along one lengthwise edge of the barrier, the first handle having a cutout opening; and
26 (d) a second handle extending upwardly along a second lengthwise edge of the barrier and
27 parallel to said first handle, the second handle having a cutout opening; (e) whereby, when a
28 child is seated on the barrier, the weight of the child compresses the front flap between the toilet

1 seat and the toilet rim to thereby cause the adapter to be held in place and the child grasps each
2 handle through its cutout so that the child remains securely on the adapter.
3

4 Defined more broadly, the present invention is a child toilet seat adapter to be used with a
5 toilet having a toilet rim and an adult full sized toilet seat rotatably resting adjacent the toilet rim,
6 the adult full sized toilet seat having a front surface including an underside having spacers on
7 opposite sides of the underside which position the front of the toilet seat away from the toilet rim
8 when the toilet seat is in its horizontal position, the child toilet seat adapter comprising: (a) a
9 barrier having a front edge and two oppositely disposed side edges, the barrier comprised of a
10 single sheet of foldable material sufficient in width to rest upon the full sized toilet seat with a
11 central cutout sized and positioned so as to provide a smaller seating surface to accommodate the
12 buttocks of a child; (b) a front flap located at the front edge of the barrier and also located
13 adjacent the front end of the toilet when the barrier is positioned on the toilet seat, the front flap
14 having a pair of oppositely disposed extensions adjacent opposite sides of the front flap, the front
15 flap folded so that it extends over the front rim of the toilet seat and extends under the front
16 surface of the toilet seat such that a respective extension extends under a respective spacer on
17 opposite locations of the underside of the toilet seat so that the front flap is sandwiched between
18 the underside of the toilet seat and the top of the toilet rim and each respective extension is
19 sandwiched between a spacer and the toilet rim; (c) whereby, when a child is seated on the
20 barrier, the weight of the child compresses the front flap and its extensions between the toilet
21 seat and the toilet seat spacer and the toilet rim to thereby cause the adapter to be held in place.
22

23 Defined even more broadly, the present invention is a child toilet seat adapter to be used
24 with a toilet having a toilet rim and an adult full sized toilet seat rotatably resting adjacent the
25 toilet rim, the adult full sized toilet seat having a front surface including an underside having
26 spacers on opposite sides of the underside which position the front of the toilet seat away from
27 the toilet rim when the toilet seat is in its horizontal position, the child toilet seat adapter
28 comprising: (a) a barrier having a front edge and two oppositely disposed side edges, the barrier

1 comprised of a single sheet of foldable material sufficient in width to rest upon the full sized
2 toilet seat with a central cutout sized and positioned so as to provide a smaller seating surface to
3 accommodate the buttocks of a child; (b) a first handle extending upwardly along one lengthwise
4 edge of the barrier, the first handle having a cutout opening; and (c) a second handle extending
5 upwardly along a second lengthwise edge of the barrier and parallel to said first handle, the
6 second handle having a cutout opening; (d) whereby, when a child is seated on the barrier, the
7 child grasps each handle through its cutout so that the child remains securely on the adapter.

8

9 Defined even more broadly, the present invention is a child toilet seat adapter to be used
10 with a toilet having a toilet rim and an adult full sized toilet seat rotatably resting on the toilet
11 rim, the adult full sized toilet seat having a front surface including an underside which rests
12 against the toilet rim, the child toilet seat adapter comprising: (a) a barrier having a front edge
13 and two oppositely disposed side edges, the barrier comprised of a single sheet of foldable
14 material sufficient in width to rest upon the full sized toilet seat with a central cutout sized and
15 positioned so as to provide a smaller seating surface to accommodate the buttocks of a child; and
16 (b) a front flap located at the front edge of the barrier and also located adjacent the front end of
17 the toilet when the barrier is positioned on the toilet seat, the front flap folded so that it extends
18 over the front rim of the toilet seat and extends under the front surface of the toilet seat so that it
19 is sandwiched between the underside of the toilet seat and the top of the toilet rim; (c) whereby,
20 when a child is seated on the barrier, the weight of the child compresses the front flap and its
21 extensions between the toilet seat and the toilet seat spacer and the toilet rim to thereby cause the
22 adapter to be held in place.

23

24 Of course the present invention is not intended to be restricted to any particular form or
25 arrangement, or any specific embodiment, or any specific use, disclosed herein, since the same
26 may be modified in various particulars or relations without departing from the spirit or scope of
27 the claimed invention hereinabove shown and described of which the apparatus or method
28 shown is intended only for illustration and disclosure of an operative embodiment and not to

1 show all of the various forms or modifications in which this invention might be embodied or
2 operated.

3
4 The present invention has been described in considerable detail in order to comply with
5 the patent laws by providing full public disclosure of at least one of its forms. However, such
6 detailed description is not intended in any way to limit the broad features or principles of the
7 present invention, or the scope of the patent to be granted. Therefore, the invention is to be
8 limited only by the scope of the appended claims.

9
10 **WHAT IS CLAIMED IS:**
